

## CLEAN SHEET OF CLAIMS AS AMENDED

1 1. A wireless provisioning device for use in public domain networks  
2 wherein the wireless provisioning device is accessible by a user of mobile computing  
3 devices, comprising:  
4 a chassis;  
5 at least one network card;  
6 at least one wireless card;  
7 at least one processor;  
8 an operating system, the operating system operably configured in the chassis  
9 to control the at least one network card, the at least one wireless card and the at  
10 least one processor, which are operatively coupled with the chassis;  
11 a packet-switched interface capable of receiving a multiplicity of inbound  
12 framed packet-data to provide inbound packets and transmitting a multiplicity of  
13 outbound framed packet-data comprising outbound packets;  
14 a channeling controller, coupled to the packet-switched interface that  
15 channels the inbound packets based on the inbound address information and  
16 constructs the outbound packets and channels the outbound packets with the  
17 outbound address information, the channeling controller capable of being  
18 effectively connected to at least one network via the operating system; and  
19 an authenticator in operative communication with the operating system to  
20 allow authentication at the wireless provisioning device; ✓  
21 whereby the user of a mobile computing device connects to the wireless  
22 provisioning device without having to first access the Internet. ✓

1 7. A wireless provisioning device, comprising:  
2 a chassis;  
3 at least one network card;  
4 at least one wireless card;  
5 at least one processor;  
6 a LINUX operating system, the operating system operably configured in the  
7 chassis to control the at least one network card, the at least one wireless card and  
8 the at least one processor;  
9 a packet-switched interface capable of receiving a multiplicity of inbound  
10 framed packet-data to provide inbound packets and transmitting a multiplicity of  
11 outbound framed packet-data comprising outbound packets;

~~A5~~  
~~Cont~~  
12 a channeling controller, coupled to the packet-switched interface that  
13 channels the inbound packets based on the inbound address information and that  
14 constructs the outbound packets and channels the outbound packets with the  
15 outbound address information, the channeling controller capable of being  
16 effectively connected to at least one network via the operating system.

~~A4~~  
1 8. The wireless provisioning device of claim 1, wherein the wireless  
2 provisioning device further comprises a second processor.

~~A4~~  
1 10. A system for allowing users to securely access public domain area  
2 networks via mobile computing devices, comprising:  
3 a plurality of wireless access points;  
4 at least one wireless provisioning device for receiving, authenticating,  
5 transmitting, and directing data over a plurality of networks and capable of  
6 sustaining connectivity between the wireless access points and the wireless  
7 provisioning device, the wireless provisioning device comprising a chassis, at least one  
8 network card, at least one wireless card, at least one processor, and at least one  
9 operating system operably configured in the chassis and associated with at least one  
10 of the plurality of wireless access points for transmitting and receiving data between  
11 the wireless access point and a carrier structure and where the wireless provisioning  
12 device is capable of accommodating multiple connections back to the wireless  
13 access point without requiring rebooting before a new roaming member can be  
14 added to the system;  
15 a carrier structure communicably positioned between the wireless provisioning  
16 device and the plurality of wireless access points for transmitting and receiving data  
17 between the wireless provisioning device and the plurality of wireless access points by  
18 means of a secure connections; and  
19 a security authentication protocol, initiated by the wireless provisioning  
20 device, capable of authenticating traffic as it passes through the carrier structure.

~~SUB B~~  
1 11. The system of claim 10, wherein the wireless provisioning device further  
2 comprises a directory services member operatively connected to the operating  
3 system thereof, which is suitable for maintaining a database directory that stores  
4 MAC addresses and billing profiles for those in the system.

~~A5~~  
~~Cont~~  
~~Sub C1~~  
1 19. A system, comprising:  
a plurality of wireless access points;

3 at least one wireless provisioning device for receiving, transmitting, and  
4 directing data over a plurality of networks and capable of sustaining connectivity  
5 between the wireless access points and the wireless provisioning device, the wireless  
6 provisioning device comprising a chassis, at least one network card, at least one  
7 wireless card, at least one processor, and at least one operating system operably  
8 configured in the chassis and associated with at least one of the plurality of wireless  
9 access points for transmitting and receiving data between the wireless access point  
10 and a carrier structure and where the wireless provisioning device is capable of  
11 accommodating multiple connections back to the wireless access point without  
12 requiring rebooting before a new roaming member can be added to the system;  
13 a carrier structure communicably positioned between the wireless provisioning  
14 device and the plurality of wireless access points for transmitting and receiving data  
15 between the wireless provisioning device and the plurality of wireless access points by  
16 means of a secure shell telnet connection; and  
17 a security authentication protocol capable of authenticating traffic as it  
18 passes through the carrier structure.

21. The system of claim 20, wherein the at least one antenna is a 2.4Ghz  
antenna.

23. A system, comprising:  
a plurality of wireless access points;  
at least one wireless provisioning device for receiving, transmitting, and  
directing data over a plurality of networks and capable of sustaining connectivity  
between the wireless access points and the wireless provisioning device, the wireless  
provisioning device comprising a chassis, at least one network card, at least one  
wireless card, at least one processor, and at least one LINUX operating system  
operably configured in the chassis and associated with at least one of the plurality of  
wireless access points for transmitting and receiving data between the wireless  
access point and a carrier structure and where the wireless provisioning device is  
capable of accommodating multiple connections back to the wireless access point  
without requiring rebooting before a new roaming member can be added to the  
system;  
a carrier structure communicably positioned between the wireless provisioning  
device and the plurality of wireless access points for transmitting and receiving data  
between the wireless provisioning device and the plurality of wireless access points by

~~A7~~  
~~10/10/17~~

18 a security authentication protocol capable of authenticating traffic as it  
19 passes through the carrier structure.

---

1 24. The wireless provisioning device of claim 1, wherein the network card,  
2 the wireless card, the processor, the operating system, the packet-switched interface,  
3 and the channel controller are operatively disposed within the chassis of the wireless  
4 provisioning device.

1 25. The wireless provision device of claim 24, wherein the authenticator is  
2 operatively disposed within the chassis of the wireless provisioning device.

1 26. The wireless provisioning device of claim 1; wherein bandwidth to  
2 individual user can be controlled by the wireless provisioning device operating  
3 system.

1 27. The wireless provisioning device of claim 1, wherein the protocol type  
2 of an individual user can be controlled by the wireless provisioning device operating  
3 system.

1 28. The system of claim 20, wherein there is more than one antenna and  
2 the user is capable of logging on and sustain connectivity with the system while  
3 transitioning antennas.

4 29. The system of claim 20, wherein the user is capable of logging onto  
5 and sustaining connectivity with the system while transitioning access points.
